KS3 PREPARATION AND FOLLOW-UP IDEAS

© Black Country Geodiversity Partnership

In-school learning in preparation for field visit to Barr Beacon / Pinfold Quarry.**List of the concepts needed.**

Sound knowledge and understanding of geological processes should form the basis of the preparatory lesson(s) at KS3 in school within the 1 to 2 weeks prior to the field visit.

KS3 geological processes**Time: 80 minutes**

In broad terms the KS3 'geological processes' is the study of the 'Rock Cycle'.

Learning objectives for KS3

1. be able to describe and explain ways in which rocks are weathered
2. be able to observe and describe the key features of a rock specimen, including colour, texture and mineral content
3. be able to classify specimens of common rock types, using observed features, as igneous, sedimentary or metamorphic, and name such common rock types
4. be able to describe and explain how sedimentary rocks may be formed by processes including the erosion, transport and deposition of rock fragments
5. be able to make reasonable suggestions as to how a common sedimentary rock type they have described was formed, and how long the process took.

A. Weathering (10 minutes)

As the basis of a brief question and answer session, use photographs of rocks that have suffered weathering. Suggested images:

- boulder(s) showing onion-skin weathering
- boulder(s) split in half – e.g. Devil's Marbles
- jagged, broken rocks on mountain ridges, preferably with patches of snow still visible.

An internet search yields many possible images for classroom use. Examples:

<http://www.geos.ed.ac.uk/undergraduate/field/holyrood/spheroids.html>

http://academic.brooklyn.cuny.edu/geology/leveson/core/topics/weathering/picturegallery/display/newjerseygarrret_mt_1.html

<http://www.au.au.com/cameras/images/devils-marbles.jpg>

http://www.thewalkzone.co.uk/Lake_District/walk_36/180203h.jpg

Some internet images provide useful background discussion about the weathering mechanisms involved. Tasks in small groups: show the pupils the photographs and give them one minute to come up with suggested causes of the weathering depicted in each image. There is probably no single 'correct' answer in any of these situations because weathering is rarely one process operating on its own. Weathering is usually caused by a combination of physical and chemical weathering processes. It is the pupils' suggestions and subsequent discussion generated that are important. If pupils do not suggest chemical weathering, the teacher may need to pump-prime the discussion by asking them whether chemical changes might be possible in any of these examples.

B. The rock cycle (35 minutes)

This session is based on the rock cycle. A simplified pictorial version of the rock cycle should be used in the session and this diagram can be downloaded from:

<http://www.washington.edu/uwired/outreach/teched/projects/web/rockteam/WebSite/rockcycle.htm.htm>

Activity 1: provide a set of six common rock types (sandstone, shale, conglomerate, granite, dolerite/basalt with crystals just visible, slate or schist or gneiss). Tasks in small groups:

- agree key features of each specimen (colour, texture, etc), and how the grains are held together (which allow them to identify whether they are sedimentary, or igneous or metamorphic).
- provide a set of name labels; groups have to decide quickly which label belongs to each specimen, and be able to justify (for able groups, provide more name labels than specimens!)
- plenary agreement on correct labelling and why the name label is appropriate.

Activity 2: teacher shows quick demonstrations of:

(1) sedimentation jar filled with water then 3 charges of different sediment (the last one being muddy to show slow fall of sediment)

(2) a volcano in a laboratory. This demonstration of a volcano uses wax and sand. Details are available from:

<http://www.earthscienceeducation.com/workshops/worksheetindex1.htm>

KS3 PREPARATION AND FOLLOW-UP IDEAS

© Black Country Geodiversity Partnership

3) effects of pressure on rocks. This simulation of the distortion of fossils by metamorphism uses modelling clay and cockleshells. Details are available at:

<http://www.earthscienceeducation.com/workshops/rockcycle/metamorphism.htm>

Task for small groups using the rock cycle diagram:

- decide what part of the rock cycle each demonstration is modelling
- decide at which point in the rock cycle each specimen would have been formed
- agree on the rough timescale needed for each rock type to have been formed, including the difference, for sedimentary rocks, between time for deposition and time for a deposit of loose sediment to be turned into a hard rock, and also how that may happen.

Activity 3: How did sediment become hard rock? This can be modelled for sandstone, as shown on the JESEI website at:

<http://www.chemsoc.org/networks/learnnet/jesei/sedimen/index.htm>

C. Sedimentary processes (35 minutes);

Introduction:

The following ideas are used in the field:

- rock fragments are abraded (have pieces broken off) during transport.
- erosion and deposition happens according to the size (weight) of the fragment in a flowing current.
- larger (heavier) fragments are usually moved by rolling along the bottom, which causes them to become rounded.
- that rounding / angularity refers to the sharpness of the edges of pebbles and can be described on a progressive scale. (Here the scale is of 1 to 6).
- that well rounded pebbles are characteristic of significant amounts of transport by water.
- that sediments become deposited together roughly according to grain size (weight) as a current slows down: larger fragments (sand and gravel) first and finer ones (muds) settling out in very quiet water.

Figure 1. Rounded and angular edges.

Activity 4: the following diagram could be used in conjunction with appropriately selected specimen pebbles to practice the description of rounding.

Figure 2. Rounded and angular pebbles.

Activity 5: pupils place cubes of sugar in a closed container and shake for 30 seconds and then observe changes to the shape and size of the cubes. Repeat activity at 30 second intervals, weighing & measuring the cubes at each stage. Tasks in small groups:

- decide what is the cause of the changes they have observed
- decide what part of the rock cycle is modelled in the experiment
- agree what will affect the degree of rounding and size reduction of rock fragments in the rock cycle.

KS3 PREPARATION AND FOLLOW-UP IDEAS

© Black Country Geodiversity Partnership

Activity 6: provide three piles of sediment (one of gravel, one of soil and one of sand) and watering cans for pupils to use to pour water over the sediments to see how far the water spreads the sediment. Tasks for pupils work in small groups:

- agree what needs to be done to ensure the test will be a fair test
- pour 2 litres of water slowly over each pile of sediment
- observe what happens and measure how far the water spreads each pile
- agree which type of material was spread further
- predict what would happen if they poured 4 litres of water over each pile of sediment.

Activity 7: teacher shows demonstrations of river erosion, transport and deposition using a child's slide extension or a very long tray covered with a sand and gravel (pea-sized) mixture.

Tasks for pupils in small groups:

- decide how the different types of sediment are moved along the river bed in this model
- agree where erosion takes place and what evidence shows that erosion has occurred here
- agree where deposition occurs and why deposition occurred at this place
- decide what different results they could expect to see if (a) the slope of the tray is increased and (b) a greater volume of water is poured into the tray.

Activity 8: teacher shows a demonstration of the formation of ripple marks using a fish tank (approximately 100cms long, 50cms deep and 50cms wide) and two wooden cylinders 3cm diameter and slightly longer than the width of the tank.

Put clean, well sorted sand of fine to medium grain size into the tank, sufficient to line the floor of the tank to a depth of several cm. Place the tank on the wooden rollers, and fill the tank with water to a depth of 15-20cm. Gently and rhythmically rock the tank back-and-forth in an oscillatory motion until ripples form on the sediment surface. (This does not take long, but there is the potential for disaster if the tank is rocked too vigorously!).

Details of **Activities 5 and 6** (and of related practical activities) are available at:

<http://www.kented.org.uk/ngfl/subjects/geography/rivers/Teacher%20Plans/whatiserosionanddeposition.htm>

D. Igneous Processes.

The igneous rocks seen on this ESO-S visit will be as pebbles on the scree in Pinfold Quarry, not in an exposure. These will be either basalt pebbles or porphyry pebbles.

Basalts are fine grained basic lavas formed by eruption onto the surface. A **porphyry** is an igneous rocks which show two distinct sizes of crystals, reflecting two periods of cooling: the first slower, allowing the larger (rectangular shaped) crystals to form, and the second faster, allowing the fine grained crystal matrix to form.

Activities:

1. Videos and three-dimensional models are useful for establishing the main ideas and definitions, but the ESEU workshop demonstration "**A volcano in the laboratory**" and the "**Lava in the laboratory**" pupil activity are extremely useful for demonstrating the processes involved, using red wax as a proxy for intrusive magma, and syrup as a proxy for extrusive lava..

Details are available at: <http://www.earthscienceeducation.com/workshops/rockcycle/volcano.htm>

2. Pupils should examine and describe crystalline igneous rocks and relate the crystal size to rate of cooling, and the overall colour to acid or basic magmas. E.g. Granite, and rhyolite (both acid rocks), and basalt and dolerite (both basic rocks). In addition a porphyry should be seen and discussed

A summary of the central ideas and definitions for this visit is given below.

1. **Magma** is liquid rock underground. (Temperatures may be above 1000^o C)
2. Basic magma derives from the **partial melting of an otherwise solid upper mantle**.
3. Igneous rocks are characterised by **interlocking crystals**.
4. **Crystal size** in an igneous rock reflects speed of cooling of a magma / lava. Fine grained crystals form in a rapidly cooling melt, coarser ones in a slower cooling melt. A **porphyry** has larger crystals in a finer matrix, reflecting a more complicated cooling history, first slower, allowing the larger crystals to form, and then faster, allowing the finer matrix to form.
5. Hot magma moves upwards through cold "country rock" by virtue of being **less dense** than those rocks. It follows lines of previous fractures such as faults and joints.
6. **Lava** is the molten rock erupted on the surface, and cools quickly to form Basalt. **Basalt** is the fine grained extrusive equivalent of **dolerite**, which crystallises more slowly underground in dykes and sills, and therefore has slightly bigger interlocking crystals.
7. Where the hydraulic pressure is insufficient to drive the intrusion further upwards through the country rock, the magma may spread out sideways, often along bedding surfaces, to form a **sill**. Vertical intrusions are called **dykes**.
8. Dykes and sills effectively "cut across" or metamorphose, the country rock and so are younger than them, (even if, as a sill, they occur above them in the quarry.) **Principle of Cross Cutting Relationships**.

KS3 PREPARATION AND FOLLOW-UP IDEAS

© Black Country Geodiversity Partnership

E. Contact Metamorphism (caused by heat)

NOTE: Outcrops of metamorphic rocks will not be seen on the visit, although metamorphic pebbles will be found, mainly quartzites, which are sandstones re-crystallised by heat. This usually happens where intruded hot molten magma loses heat to the surrounding rocks as it cools and crystallises, baking the surrounding rock. This baking of rocks is known as contact metamorphism. Sandstones recrystallise to form quartzite and limestones recrystallise to form marble during contact metamorphism, but no marble will be seen on this visit.

The easiest material to “contact metamorphose” in the laboratory is clay. When clay-rich rocks are baked they re-crystallise and harden. Inspection of the properties of clay before and after firing in a pottery kiln is instructive, as well as looking closely at specimens of limestone and marble through a hand lens (or a microscope in thin section).

FOLLOW-UP WORK.**1. SUMMARISING THE ROCK CYCLES:**

The suggested follow up work is a summary of the evidence for the two rock cycles seen during the visit to Barr Beacon / Pinfold Quarry. As an alternative, the more graphical, last worksheet could be used instead. A completed copy of the follow-up work can be found in **BB9 Field Leader’s Notes**. Alternatively, the final exercise on building stone could be used.

2. BUILDING STONES SURVEY:

Using the ideas from the preparation exercises pupils conduct a survey of the use of different building materials in the area of the school, using the worksheets at the end of this document.

After the **On-Site** visit, as a homework exercise, pupils are asked to describe in detail two uses of stone as part of a survey of building stone in the local area.

The term “building” may need to be very loose. Suitable sites could include a local church, gravestones (helpfully dated), school buildings, local walls, high street shop fronts, kerbstones, cobblestones, local monuments, bridges, and the pupil’s own home. In particularly unhelpful areas concrete, cement and bricks could be designated as “man-made” stone for the purpose of this exercise.

Teachers (or pupils) should identify two sites to work on (perhaps taken from the preparatory homework exercise above). Remind pupils about situations where permission is required, and appropriate behaviour is expected. Also, draw attention to thoughts about safety, if kerbstones, or a cobbled road is chosen.

Pupils should record:

- the location or address of the building/construction.
- a sketch of the relevant part of the site, labelling the rock being surveyed, and the use to which it has been put.
- A description of at least two different rocks (perhaps on two buildings) and the use to which they have been put. For each describe the rock, identify it as igneous, metamorphic, or sedimentary, and give the reason it has been used for this purpose.
- Finally record the evidence for the effects of weathering on the chosen rock, identifying the kind of weathering responsible, giving the reasons for their conclusion.

Suitable copies of homework record sheet for the follow-up exercise are to be found on the following page.
